

Open Access - Seeking balance

Summary of Day One

- Eva Hnátková, Eurodoc President
- KRECon 2019
- NTK in Prague
- 7-8 November 2019

eurodoc

The European Council of Doctoral
Candidates and Junior Researchers

eva.hnatkova@eurodoc.net
[@EvaHnatkova](https://twitter.com/EvaHnatkova) | eurodoc.net

Eurodoc = early-career researchers

- non-profit organisation
- based in Brussels (2002)
- 28 national associations
- funded by member fees
- supported by volunteers
- develop & inform policy
- run workgroups & events

O'Neill & Krūmiņa (2018)

Czech Landscape

- National Strategy 2017-2020 → requires OA
- Action Plan for implementation (Apr 2019)
- Open/FAIR data policy
- Reviewing Research Assessment
(external influence → governments,
funders, competitive environment)
- Transfer the current publishing system
subscription-based → to gold open access

Train, support, & reward Open Science

Impact Outlook

- "Open Science will be the new way of conducting research by opening up access to research data and results via new digital technologies and collaborative tools"
- A main question for us is to what extent will early-career researchers need to be trained for these practices and what is the role of early-career researchers in the shift to Open Science?

GARRET O'NEILL is a Professor of English at the University of Nottingham in Nottingham, UK. He is President of Eurodoc, and an expert on Open Science, having organized the first Eurodoc Conference on Open Science in the Netherlands and the European Conference.

eva.hnatkova is a Czech, English, and German speaking researcher interested in improving higher education and research in Europe. She is a General Board Member and coordinator of the Eurodoc Training in Brussels.

Open science for early-career researchers

Gareth O'Neill, President, and Eva Hnátková, General Board Member/WG Doctoral Training, explain why Open Science is a strategic priority within the European Council of Doctoral Candidates and Junior Researchers (Eurodoc)

Open your publications, or make it transparent! Europe's position is a global leader. It is essential to support and foster open access to science and research!

WG2: The implementation of Open Science is fundamental to the "New Vision for Europe" proposed by the European Commission (EC) in its Communication on Research and Innovation Strategy for Europe 2020. Open Science is defined as "the principle of making research data and results via new digital technologies and collaborative tools. Open Science is already just one part of a broader strategy to encourage innovation, support open research and innovation in Europe. Open innovation will bring more added value to the innovation ecosystem. Open Science will promote research and networking between researchers, funding programmes, institutions and society. Open Science will promote international cooperation and scientific dialogue, as well as address the challenges of the future. Open Science will help to make Europe a global and innovative research hub. Opening up research data and results will also facilitate the reuse of research data and results from other researchers in further data development and innovation, and will spur productive research. This approach will bring significant benefits to the innovation ecosystem, which may not be able to afford the often high costs for research to researchers through commercial partnerships.

What are the goals of Eurodoc in relation to Open Science and the role of the WG2? In simple terms, what does Eurodoc do for Open Science and who are our main stakeholders?

By www.eurodoc.net

Gareth O'Neill responds to the example of Open Science and self-assess that the results and studies of early career researchers (ECRs) are taken into account in the development of Open Science policies. Gareth O'Neill is the key member behind Open Science in Europe. Open Data is the key word here because most modern Open Science is based on the reuse of existing data sets. Open Data is essentially the backbone of Open Science. Researchers are generally unaware of what Open Science is, so we have to explain it to them. We have been working on Open Science in several Data Management Plans or internal training for early-career researchers. We have been working on Open Science at their institutions, with researchers saying that there are no institutional/training guidelines as well as no general guidelines supporting them with Open Science. So, we have been trying to implement a clear Open Science policy and tried to encourage previously supported them with Open Science funds of money to also appear on national levels. Most countries in Europe have not yet adopted Open Science as a national policy. We have been trying to get countries to introduce Open Science as a strategic priority. For the most cultural shift to occur, Open Science must be encouraged and supported by governments, universities, governments, students, and the research themselves.

Eva: Open Science consists of a mix of different practices and an overall aspect that ECRs can and should be trained in all of these processes. We have been working on the awareness and the overall leverage of Open Science and spread knowledge of research data management and the importance of making research output FAIR (Findable, Accessible, Interoperable, Reusable) Open Data, the use of Data Management Plans and mandates, Open Education, and Open Innovation. We have been working on the implementation of an optional Open Science code of conduct that is embedded in the (postdoctoral) training programme of ECRs. These courses should further develop the skills of ECRs in Open Science. ECRs can learn how to train the training of doctoral students at institutions in Europe. These two WGs are working closely together to train ECRs for Open Science.

What are the goals of Eurodoc in relation to Open Science and the role of the WG2? In simple terms, what does Eurodoc do for Open Science and who are our main stakeholders?

By www.eurodoc.net

Selected Training Principles and in the European Framework for Research Careers, 2020: training, however, is not enough. A change in culture also needs to be accompanied by awareness raising, communication, planning and support for Open Science and ECRs. Eurodoc has developed methods to do this through the Open Science and ECRs Facebook groups and the Open Science and ECRs LinkedIn group.

WG3: Open Science is one of Eurodoc's main priorities. We have identified key issues for all researchers and especially for ECRs across Europe. Researchers are generally unaware of what Open Science is, so we have to explain it to them. We have been working on Open Science in several Data Management Plans or internal training for early-career researchers. We have been working on Open Science at their institutions, with researchers saying that there are no institutional/training guidelines as well as no general guidelines supporting them with Open Science. So, we have been trying to implement a clear Open Science policy and tried to encourage previously supported them with Open Science funds of money to also appear on national levels. Most countries in Europe have not yet adopted Open Science as a national policy. We have been trying to get countries to introduce Open Science as a strategic priority. For the most cultural shift to occur, Open Science must be encouraged and supported by governments, universities, governments, students, and the research themselves.
